## Protecting Users' Location Data From An Unconstitutional Search

Editor's note: Eric Gundersen is the CEO of Mapbox. Location data is highly sensitive. It contains information about where we live, our daily habits and our network of friends. We discover new places to go; avoid traffic on the way there; swipe to meet new friends once we've arrived; and even turn up the thermostat before we get home. When data knows this much about us it requires careful protection. The U.S. 4th Circuit Court of Appeals is likely just weeks away from a major ruling on whether the Fourth Amendment protects a user's data, and developers need to be prepared for whatever decision comes down. There are clear technical approaches to securing location data. Data must not only be anonymized and aggregated, but also secured with techniques like on-device encryption and tamper-proof hardware security keys. Measures like these can protect against unauthorized access. But what happens when the authorities tell you to remove those safeguards, unlock those keys and look at that data?

## How To View Your Mac's Calendar From Within Any App (for free) | Tera Talks

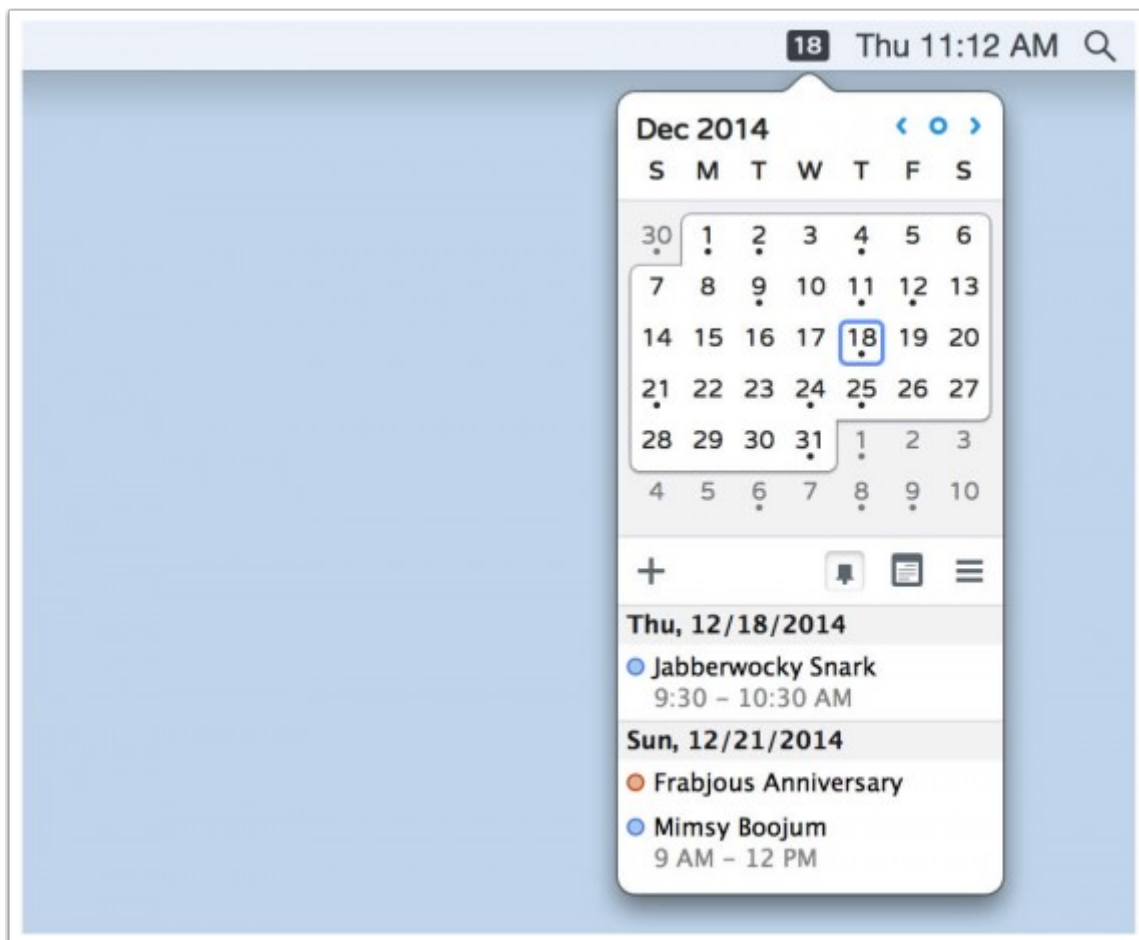

Apple is famous for giving Mac, iPhone, and iPad customers a good user experience right out of the box, rather than dumping in hundreds of features that most people never use and letting them figure out things for themselves.

That distinction is obvious, but there are times when Apple leaves useful functionality off the table. For example, let's say you want to check the Calendar while you're browsing in Safari. Command-Tab, or click the Calendar icon in the Dock, or change Spaces, or invoke a Dashboard widget. Or, place an itsy bitsy teeny weeny calendar into the Mac's Menubar so you can see Calendar events with a single click and from within any Mac app. It's called [Itsycal](#) for Mac and it couldn't be easier to install and use. And it's free.

One click gets you this.

What you get is a simple dropdown calendar which displays the current month and upcoming events from your Calendar. There are options to navigate forwards and backwards to different months. Plus, you can create and delete events, but not edit a Calendar event.

Despite the price tag (none), Itsycal is surprisingly robust, even for Mac power users who prefer not to move hands from keyboard to mouse or trackpad. Itsycal has keyboard shortcuts to navigate months, check today, toggle weeks and months, create a new event, even open Calendar itself. That's a good deal for free, and exactly the kind of usefulness Apple normally provides.

## **Top 5 Must-Have Mac OS X Apps Which Every Apple User Should Download | Redmond Pie**

## Review\_ Spigen's Liquid Crystal Case protects the Apple Watch from scrapes and scratches -- AppAdvice

**Company:** Spigen

**Product:** Liquid Crystal Case

**Price:** \$14.99

**Compatibility:** 38mm or 42mm Apple Watch

**Website:** <http://www.spigen.com>

**Date:** May 6, 2015

### The Product

Even though most buyers are still probably waiting for their Apple Watch to arrive, accessories for the device are finally beginning to trickle out. Many different stands, docks, and other companions for the watch have been announced, but most are still in the preorder stage or slated to arrive sometime later this month or in early June.

But Spigen has always been known for its ability to have iPad or iPhone accessories on the market right after, or even before, a new device arrives. And the company has continued the trend with the Apple Watch.

Along with a line of docks and screen protectors, the company also has a number of cases for the Apple Watch. Yes, cases. Just like options for your iPhone or iPad, the Liquid Crystal case covers the entire watch body except for the screen. There is a large cutout on the back for the heart rate sensor and smaller holes for the microphone, speaker, and Digital Crown. The side button is completely covered with the case's material, but it still can be pressed easily.
