Master resource for features, tips and guides by Sharon Profis of CNet

OS 10 is here. Even though it looks just like iOS 9, a lot -- and we mean **a lot** -- of features are radically different. Messages is a lot more like Facebook Messenger, the lock screen packs a lot more info, and you can finally delete Apple's default apps.

10 Things iOS 10 Still Needs by Scott Kleinberg

It's always fun when Apple updates its software. We usually first hear about the updates on the gossip websites and then get the full scoop from Apple at WWDC. There are always a lot of new features, and some — but rarely all — are very noteworthy and exciting.

There's usually a gap of several months from when we're enticed, to the moment when we actually get to see it on our devices. During that gap, things get interesting. Apple releases developer beta and public beta versions of the software; developer beta for people actually programming for the new OS, and public beta for the people who truly can't wait and are willing to risk a complete system meltdown just for the chance to try it early.

Each time a new version is released, people search deep in the code to find changes and references to features not yet announced or even new hardware. It's a treasure trove of sorts, and it's here where we get some of the juiciest rumors.

iOS 10 is no different. We heard about how great it would be and salivated for months. Something about going from 9 to 10 makes us believe we're in for something extra special, as anyone who remembers the early days of OS X will tell you. And now that it's here, it's great. Extra special in many ways, but it could certainly be better.

So let's take a look at 10 things iOS 10 still needs, in no particular order.
